

Visualisation system for a crisis command room

Some further elaboration about the visualisation we made.

Dashboard: The dashboard is the main screen of the medical professional in the command centre. On this screen he has access to all important information, from the drone itself and the information it is collecting.

Fleet: When the professional clicks on fleet he gets access to the total amount of drones. He can see their GPS location and get an overview of all the drones, and where they have been.

Map: When opening the map you get access to the area where the drones are located. You see the radius where drones can be diploid and the limited distance of the drones.

Reports: When you click on reports you see an overview of the reports that were created by the drones. You can not open them without a valid reason.

Abort mission: Can be used when something goes wrong or paramedics are already on sight.

Return home: Is returning after a successful mission
